

□ GigGuard Phase 1 Pitch Script

Target Length: 2 Minutes (~280 words) Format: Single Speaker / Solo Pitch directly to camera.

□ [0:00 - 0:25] THE STRATEGY & PROBLEM

[Tone: Empathetic, story-driven]

"Hi judges, we are Team GigGuard.

Meet Rahul: one of India's 1.2 crore gig workers delivering for Zomato. He works 12-hour shifts to net just 800 rupees a day. But last Tuesday at 7 PM, a massive cloudburst hit Mumbai. Rahul had to log off for his own safety. He lost his peak-hour earnings, his daily incentives, and his only source of income for the day. He has zero safety net.

Our strategy is to fix this with **GigGuard**—an AI-powered parametric insurance platform."

□ [0:25 - 0:50] THE BUSINESS MODEL

[Tone: Confident, explaining the business model]

"Traditional insurance takes weeks; GigGuard takes seconds.

Because gig workers operate week-to-week, our strategy relies on a 3-tier Weekly Micro-Premium model starting at just 30 rupees a week. Our AI risk-engine dynamically prices this premium based on 10 years of meteorological data for Rahul's specific delivery zone down to the municipal ward."

□ [0:50 - 1:15] THE PROTOTYPE (Minimal Scope)

[Tone: Excited, technical]

"For our Phase 1 minimal prototype, we have modeled the core parametric logic.

We integrated the OpenWeatherMap API and MapMyIndia traffic data. The moment rainfall exceeds our 40-millimeter threshold, and our data confirms severe road blockages in Rahul's geo-fenced commercial zone, our backend logic executes an instant UPI payout directly into his wallet. No paperwork, no waiting."

□ [1:15 - 1:40] ADVERSARIAL DEFENSE PIVOT

[Tone: Authoritative. The "mic-drop" moment indicating you solved the 24-hr threat]

"But to protect this system from GPS-spoofing fraud rings, simple GPS tracking is dead.

Our prototype logic uses an Adversarial Defense architecture. We triangulate Cellular Tower IDs and scan local Wi-Fi MAC addresses. If an app says you're in a flooded market, but your network pings a residential tower 30 kilometers away, the claim is auto-rejected. If the network drops legitimately, we pause the payout and ask for a 3-second photo of the flooded street."

□ [1:40 - 2:00] PLAN OF EXECUTION (Phase 2 & 3)

[Tone: Strong, team-focused, forward-looking]

"Our Plan of Execution is clear: In Phase 2, we are turning our Figma wireframes into a React Native mobile app and wiring these live API triggers. In Phase 3, we deploy the computer vision anti-fraud model and the Razorpay sandbox for instant payouts.

We are Team GigGuard, and we are building the missing livelihood net. Thank you."
