

GigGuard — Demo Video Script

Guidewire DEVTrails 2026 | Team Neural Ninjas
Phase 3 Final Submission | Duration: 3 Minutes

Overview

This script is optimized for an admin-focused demonstration of the GigGuard platform. It emphasizes the machine learning backbone, the automated payout pipeline, and the comprehensive administrative control panel.

Pacing Guide

Section	Time	Screen Visuals
Hook + Onboarding	0:00 – 0:25	Title → Splash → Signup → Dashboard
ML Engine + Pricing	0:25 – 1:00	Dashboard → Risk Gauge → Plan Cards
Fraud Firewall + Trust	1:00 – 1:40	Judge Sandbox → Fraud Logs → Trust Tier
Autopay Pipeline	1:40 – 2:15	Background Processing → Push Notif → Passbook
Admin Dashboard	2:15 – 2:50	Admin Login → Analytics → Admin Actions
Closing	2:50 – 3:00	Closing Card with Logo

Script Segments

SECTION 1: HOOK + ONBOARDING (0:00 – 0:25)

Screen: *Title card → Splash → Signup → Location → Dashboard loading*

“12 million gig riders in India lose up to 30% of their income to extreme weather, with zero safety net. GigGuard fixes this with fully automated, parametric micro-insurance. Zero paperwork. Payouts in 3 seconds.

Our React Native app onboards riders in under a minute via Firebase Auth to a MongoDB backend. Crucially, we get GPS permissions. Our engine isn’t tied to a city—it’s GPS-portable across India.

Once we have GPS, the AI takes over.”

SECTION 2: ML ENGINE + PRICING (0:25 – 1:00)

Screen: *Dashboard live data → 7-day forecast → PlanSelectionScreen*

“The Dashboard instantly pulls 14 days of Open-Meteo weather data and elevation. This feeds our custom XGBoost v2.1 model.

The specs: 39 engineered features, trained on 126,000 rows across 35 zones. Test R-squared is 0.8795. It’s loaded natively as a .ubj binary, saving 100MB of RAM. The model predicts a daily loss ratio.

Simultaneously, we evaluate 6 IMD-calibrated disruption triggers—like 65mm Heavy Rain, GPS-adaptive Extreme Heat, and a Delhi NCR Severe AQI proxy.

The AI quotes 3 affordable plans: Basic capped at ₹49/week, Standard at ₹99, and a dynamically priced Premium tier. Pricing includes 5 micro-adjustments, like zone safety discounts and multi-trigger compound surcharges, with Razorpay Sandbox handling the checkout.”

SECTION 3: FRAUD FIREWALL + TRUST SCORE (1:00 – 1:40)

Screen: *Judge Sandbox (Sandbox Icon) → Trigger pipeline logs → Coverage screen*

“To prevent abuse, we built a 7-layer Fraud Firewall. Using the Judge Sandbox, watch it evaluate: it checks a 40km Haversine Geofence, OSRM road-speed kinematics to catch impossible travel, IP Sentinel for proxies, and a 3D Topographical elevation trap.

Failing these layers generates a composite FraudVerdict from 0 to 100.

This ties into our Unified Trust Score. Every rider starts at 50. Veterans over 80 get a fast 2-hour vesting period—meaning they can claim soon after buying. Suspicious riders under 25 face 24-hour holds and hard locks. This vesting stops ‘panic buying’ right before a storm.

But as a UX innovation, your very first policy always activates in 2 hours, so new users instantly feel protected.”

SECTION 4: AUTOPAY PIPELINE (1:40 – 2:15)

Screen: *Background processing graphic → Push Notification → Wallet/Passbook*

“How do payouts actually happen? An APScheduler cron job runs every 5 minutes on our FastAPI backend. It scans active policies, fetches live weather, runs the fraud checks, and evaluates the 6 triggers.

If a trigger fires, it checks our Flash Crash Circuit Breaker. This sliding-window deque caps total platform payouts at ₹50,000 per 5 minutes to prevent coordinated drain attacks. It also ensures the same trigger hasn’t paid out in the last 24 hours.

If all green, it executes a simulated instant auto-settlement with mock UTR generation in 10 seconds. The rider gets a push notification and sees the credit in their Passbook. Zero human intervention.”

SECTION 5: ADMIN DASHBOARD (DEDICATED) (2:15 – 2:50)

Screen: *Web Admin Panel Login → Metrics Dashboard → Rider Directory*

“To manage this autonomous system, we built a comprehensive Admin Analytics Dashboard.

Admins get bird’s-eye visibility: total active policies, live platform loss ratios, and aggregated premium vs. payout charts. We track exactly which geographic triggers are firing most frequently.

The dashboard visualizes the Trust Distribution of the entire rider base. From here, admins have superpowers: they can monitor the Flash Crash circuit breaker, simulate zero-touch payouts for city-wide testing, or trigger a platform outage simulation to ensure fail-safes work.

They can also drill down into any individual rider’s fraud audit trail and issue manual bans if needed. Plus, if the weather API drops during this demo, our backend automatically falls back to mock data so the app never crashes.”

SECTION 6: CLOSING (2:50 – 3:00)

Screen: *Closing card with GigGuard logo & GigBot floating button*

“With an 88% accurate ML model, 7 fraud layers, trust-adaptive vesting, a 5-minute automated payout engine, and full admin command...

Weather can’t stop gig workers from earning. GigGuard makes sure of it.

Team Neural Ninjas. Thank you.”

Quick Reference — Key Numbers

Metric	Value
ML Model	XGBoost v2.1 (.ubj native binary)
Features	39 (across 5 categories)
Training Data	126,175 rows · 35 zones · 10 years
Test R^2	0.8795 (87.95%)
Fraud Layers	7-layer composite system
Trust Score Range	0–100 (4 dynamic tiers)
Autopay Interval	Every 5 minutes (APScheduler)
Flash Crash Limit	₹50,000 per 5-minute window
